Abstract:
This project involves developing an interactive restaurant website for "The Wooden Plate" that includes features such as user account management, menu browsing, table reservation, and online order placement. The website will display a menu with item details, enable users to book tables, and allow customers to place orders. The website will also include sections like home, about us and contact us. Built with Flask for backend integration and HTML, CSS, and JavaScript for the frontend, the website is responsive and designed to offer a smooth user experience across devices. Enhanced with dynamic features such as user authentication, reservation handling, and order management, this platform aims to improve customer engagement, streamline operations, and strengthen the restaurant's online presence.
